

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Cooke's 'Second Annual Report of Bird Counts in the United States.'¹—This posthumous work of Prof. Cooke's is a further report upon an investigation which was originated by him and in which he was deeply interested. His idea was to obtain as many carefully made counts as possible of the number of birds breeding on definite areas of farm land and with these as a basis, estimate the actual number of breeding birds over much larger areas. No less than 315 counts were received for 1915, covering nearly all the States of the Union, but mainly as in 1914, from the northeast. A comparison of the reports from this region for the two years, we have as the average bird population for each 100 acres of the area covered, 119 pairs in 1914 and 125 pairs in 1915.

Many other interesting facts are demonstrated and while it is too early to draw detailed deductions the practicability and importance of this line of investigation are clearly shown, and it is to be hoped that the Biological Survey will continue the compilation of data on the lines which Prof. Cooke laid down.—W. S.

Pearl and Curtis on Dwarf Eggs.²—In this paper the character and cause of 'runt' eggs are discussed at great length. It seems that these dwarf eggs usually occur but once or twice in the history of one bird, and are generally due to some temporary stimulation and are not correlated with a morphological disturbance of the sex organs.

Some dwarf eggs are yolkless while others contain small yolks. While the authors' study has been based entirely upon eggs of the domestic fowl their conclusions undoubtedly apply to other birds as well.—W. S.

Shufeldt's 'Osteology of Palæornis, with other Notes on the Genus.'³—In spite of a colored plate and numerous photographic reproductions of portions of the skeleton, this paper is disappointing, since one fails to get a clear idea upon what points the author bases his conclusion that *Palæornis* and its allies "constitute a subfamily" of Psittacidae. There are detailed descriptions of the skeletal parts, most of which "seem to form no exception to the general rule for Psittaci," "are as in all of the Psittaci examined" etc. In other cases comparisons are made with *Ara* and *Amazona* and less frequently with *Cacatua* and *Conurus*, but nowhere is there a comparative table or a summary from which one can get the evidence.

The nomenclature used is a little unfortunate for while *Amazona* is rightly used instead of *Chrysotis*, the present day changes in the names
